

1. **Clone the Repository:** This will download all the project files from GitHub to your computer.

- Open your terminal or command prompt.
- Navigate to the folder where you want to keep our project.
- Copy the clone URL from our repository page on GitHub. It will look like this:

<https://github.com/zaara01-sk/cakeshop-website-g7.git>

- Run this command in your terminal:

Bash

`git clone https://github.com/zaara01-sk/cakeshop-website-g7.git`

2. **Create Your Own Branch:** This is a super important step. We will each work on our own separate branch to avoid messing with each other's code. This is what helps us work together without conflicts.

- Move into the project folder:

Bash

`cd cakeshop-website-g7`

- Create and switch to your personal branch. Use the name from our README.md file. For example:

- **Member A:** `git checkout -b member-a-homepage`
- **Member B:** `git checkout -b member-b-products`
- **Member C:** `git checkout -b member-c-classes`

3. **Start Your Work:** Now you can start working on your assigned tasks

4. **Save Your Progress:** As you make changes, save your work with these three commands. Do this often!

- `git add` . (This stages your changes)
- `git commit -m "Your clear message here"` (This saves your changes)
- `git push origin [your-branch-name]` (This uploads your changes to GitHub)
